- 4 SPARQL Update
- 5 SPARQL Service Descriptions
- 6 Summary

Agenda

- 1 Recap
- 2 SPARQL 1.1 Query Extensions
 - Expressions in Selection and Bindings
 - Aggregates
 - Subqueries
 - Property Paths
 - Negation
- 3 SPARQL Protocol
- 4 SPARQL Update
- 5 SPARQL Service Descriptions
- 6 Summary

Example Pattern

Example

```
{ ?book ex:price ?price
  FILTER (?price < 15)
  OPTIONAL { ?book ex:title ?title }
  { ?book ex:author ex:Shakespeare } UNION
  { ?book ex:author ex:Marlowe } }
```

Parts of the SPARQL Grammar

| | | |
|--------------------------|-----|--|
| GroupGraphPattern | ::= | '{' TriplesBlock? ((GraphPatternNotTriples Filter)'? TriplesBlock?)* }' |
| GraphPatternNotTriples | ::= | OptionalGraphPattern GroupOrUnionGraphPattern GraphGraphPattern |
| OptionalGraphPattern | ::= | 'OPTIONAL' GroupGraphPattern GroupGraphPattern |
| GroupOrUnionGraphPattern | ::= | GroupGraphPattern ('UNION' GroupGraphPattern)* |
| Filter | ::= | 'FILTER' Constraint |

Correspondence Pattern vs. Grammar

Example

```
{ ?book ex:price ?price
  FILTER (?price < 15)
  OPTIONAL { ?book ex:title ?title }
  { ?book ex:author ex:Shakespeare } UNION
  { ?book ex:author ex:Marlowe } }
```

Corresponding Grammar Elements

```
{ TriplesBlock
  Filter
  OPTIONAL { TriplesBlock }
  { TriplesBlock } UNION
  { TriplesBlock } }
```

Correspondence Pattern vs. Grammar

Grammar Elements

```
{ TriplesBlock
  Filter
  OPTIONAL { TriplesBlock }
  { TriplesBlock } UNION
  { TriplesBlock }
```

Corresponding Grammar Elements

```
{ TriplesBlock
  Filter
  OptionalGraphPattern
  GroupOrUnionGraphPattern }
```

Corresponding Grammar Elements

```
GroupGraphPattern
```

translate(GroupGraphPattern G)

Input: a GroupGraphPattern $G = (e_1, \dots, e_n)$

Output: a SPARQL algebra expression A

```
1: A := Z { the empty pattern}
2: F :=  $\emptyset$  { filter}
3: for  $i = 1, \dots, n$  do
4:   if  $e_i$  is FILTER( f ) then
5:     F :=  $F \cup \{f\}$ 
6:   else if  $e_i$  is OPTIONAL { P } then
7:     if translate(P) is Filter(F', A') then
8:       A := LeftJoin(A, A', F')
9:     else
10:      A := LeftJoin(A, translate(P), true)
11:   else
12:     A := Join(A, translate( $e_i$ ))
13: if  $F \neq \emptyset$  then
14:   A := Filter( $\bigwedge_{f \in F} f$ , A)
15: return A
```

`translate(GroupOrUnionGraphPattern G)`

Input: a `GroupOrUnionGraphPattern G`
with elements e_1, \dots, e_n

Output: a SPARQL algebra expression `A`

- 1: **for** $i = 1, \dots, n$ **do**
 - 2: **if** `A` is undefined **then**
 - 3: `A := translate(e_i)`
 - 4: **else**
 - 5: `A := Union(A, translate(e_i))`
 - 6: **return** `A`
-

Translation into SPARQL Algebra

```
Filter(?price < 15,  
  Join(  
    LeftJoin(Join(z,  
      Bgp(?book <http://eg.org/price> ?price)),  
      Bgp(?book <http://eg.org/title> ?title),  
      true),  
    Union(Bgp(?book <http://eg.org/author>  
      <http://eg.org/Shakespeare>),  
      Bgp(?book <http://eg.org/author>  
        <http://eg.org/Marlowe>))))))
```

Simplification of the SPARQL Algebra

```
Filter(?price < 15,  
  Join(  
    LeftJoin(Bgp(?book <http://eg.org/price> ?price),  
             Bgp(?book <http://eg.org/title> ?title),  
            true),  
    Union(Bgp(?book <http://eg.org/author>  
           <http://eg.org/Shakespeare>),  
          Bgp(?book <http://eg.org/author>  
              <http://eg.org/Marlowe>))))
```

Semantics of the SPARQL Algebra Operators

| | |
|--------------------------------|--|
| $\text{Bgp}(P)$ | match/evaluate pattern P |
| $\text{Join}(M_1, M_2)$ | conjunctive join of solutions M_1 and M_2 |
| $\text{Union}(M_1, M_2)$ | union of solutions M_1 with M_2 |
| $\text{LeftJoin}(M_1, M_2, F)$ | optional join of M_1 with M_2 with filter constraint F (<code>true</code> if no filter given) |
| $\text{Filter}(F, M)$ | filter solutions M with constraint F |
| Z | empty pattern (identity for join) |

Agenda

- 1 Recap
- 2 SPARQL 1.1 Query Extensions
 - Expressions in Selection and Bindings
 - Aggregates
 - Subqueries
 - Property Paths
 - Negation
- 3 SPARQL Protocol
- 4 SPARQL Update
- 5 SPARQL Service Descriptions
- 6 Summary

Expressions in the Selection and Bindings

Solutions can be extended by evaluated expressions with (expression AS ?var) used for the assignment:

- In the `SELECT` clause
- In the `GROUP BY` clause
- Within `BIND` in a group graph pattern

Solutions from a group can further be joined with solutions given via `VALUES`

Example BIND (without Prefix Declarations)

Data

```
ex:Book ex:title "SPARQL Tutorial" ; ex:price 42 ; ex:discount  
10 .
```

Query

```
SELECT ?title ?price WHERE  
{ ?b ex:title ?title; ex:price ?p; ex:discount ?r  
  BIND ((?p-?r) AS ?price) }
```

Result

```
?title ↦ "SPARQL Tutorial", ?price ↦ 32
```

↪ Algebra: $\text{Extend}(\text{Bgp}(\dots), ?price, (?p-?r))$

Example SELECT Expressions (without Prefix Declarations)

Data

```
ex:Book ex:title "SPARQL Tutorial" ; ex:price 42 ; ex:discount  
10 .
```

Query

```
SELECT ?title ((?p-?r) AS ?price) WHERE  
{ ?b ex:title ?title; ex:price ?p; ex:discount ?r }
```

Result

```
?title ↦ "SPARQL Tutorial", ?price ↦ 32
```

↔ Algebra: $\text{Extend}(\text{Bgp}(\dots), ?price, (?p-?r))$

Example VALUES

Data

```
ex:Book1 ex:title "SPARQL Tutorial".  
ex:Book2 ex:title "SemWeb".
```

Query

```
SELECT ?title WHERE {  
  ?b ex:title ?title  
  VALUES ?b { ex:Book1 }  
}
```

Result

```
?title ↦ "SPARQL Tutorial"
```

↔ Bindings are conjunctively joined

Aggregates

- Aggregates allow for grouping of solutions and the computation of values over the groups

Aggregates

- Aggregates allow for grouping of solutions and the computation of values over the groups

Example

```
SELECT      (COUNT(?student) AS ?c) ?lecture
WHERE      { ?student ex:attends ?lecture }
GROUP BY   ?lecture
HAVING     ?c > 5
```

Aggregates

- Aggregates allow for grouping of solutions and the computation of values over the groups

Example

```
SELECT      (COUNT(?student) AS ?c) ?lecture
WHERE      { ?student ex:attends ?lecture }
GROUP BY   ?lecture
HAVING     ?c > 5
```

- `GROUP BY` groups the solutions (here into students who attend the same lecture)
- `COUNT` is an aggregate function that counts the solutions within a group (here the number of students in the lecture)
- `HAVING` filters aggregated values

Aggregates in SPARQL 1.1

SPARQL 1.1 supports the following aggregate functions, which are evaluated over the values in a group:

- COUNT – counts the solutions
- MIN – finds the minimal value
- MAX – finds the maximal value
- SUM – sums up the values
- AVG – computes the average
- GROUP_CONCAT – string concatenation, Example: `GROUP_CONCAT (?x ; separator=", ")`
- SAMPLE – picks a random value

Exercise Aggregates

Data

```
ex:Paul ex:hasMark 2.0 .  
ex:Paul ex:hasMark 3.0 .  
ex:Mary ex:hasMark 2.0 .  
ex:Peter ex:hasMark 3.5 .
```

Query

```
SELECT ?student (AVG(?note) as ?avg)  
WHERE { ?student ex:hasMark ?note }  
GROUP BY ?student  
HAVING (?avg > 2.0)
```

Solution Aggregates

Solution Aggregates

| student | avg |
|----------------|------------|
| ex:Paul | 2.5 |
| ex:Peter | 3.5 |

Subqueries

Query

```
SELECT ?name WHERE {  
  ?x foaf:name ?name .  
  { SELECT ?x (COUNT(*) AS ?count)  
    WHERE { ?x foaf:knows ?y . }  
    GROUP BY ?x  
    HAVING (?count = 3)  
  }  
}
```

- Results for the inner query are conjunctively joined with the results of the outer query

Regular Expressions in Patterns

Property Paths are constructed using regular expressions over predicates

- Paths with arbitrary length: $?s\ ex:p^+ ?o$, $?s\ ex:p^* ?o$
- Alternative paths: $?s\ (ex:p_1|ex:p_2) ?o$
- Negation of paths: $?s\ !ex:p ?o$
- Inverse paths: $?s\ ^ex:p ?o$ **same as** $?o\ ex:p ?s$
- Sequence of paths: $?s\ ex:p_1 / ex:p_2 ?o$
- Length zero or one path: $?s\ ex:p? ?o$

Regular Expressions in Patterns

Property Paths are constructed using regular expressions over predicates

- Paths with arbitrary length: $?s \text{ ex:p}^+ ?o$, $?s \text{ ex:p}^* ?o$
- Alternative paths: $?s (\text{ex:p}_1 | \text{ex:p}_2) ?o$
- Negation of paths: $?s !\text{ex:p} ?o$
- Inverse paths: $?s \text{ }^\wedge\text{ex:p} ?o$ **same as** $?o \text{ ex:p} ?s$
- Sequence of paths: $?s \text{ ex:p}_1 / \text{ex:p}_2 ?o$
- Length zero or one path: $?s \text{ ex:p} ? ?o$

- Property paths are, where possible, translated into standard SPARQL constructs
- Some new operators are still necessary

Property Path Example

Query 1

```
PREFIX ...  
SELECT ?xName WHERE {  
  ?x rdf:type foaf:Person .  
  ?x foaf:name ?xName  
  ?x foaf:knows/foaf:knows/foaf:name "Bill Gates" .  
}
```

Query 2

```
PREFIX ...  
SELECT ?s WHERE {  
  ?s rdf:type ?type .  
  ?type rdfs:subClassOf* ex:SomeClass .  
}
```

Negation in Queries

- Two forms of negation with conceptual and small semantic differences
 - 1 Test non-matches for a pattern
 - 2 Removal of matching patterns

1. Filter

```
SELECT ?x WHERE {  
  ?x rdf:type foaf:Person .  
  FILTER NOT EXISTS { ?x foaf:name ?name }  
}
```

2. Minus

```
SELECT ?x WHERE {  
  ?x rdf:type foaf:Person .  
  MINUS { ?x foaf:name ?name }  
}
```

Evaluation of Negation via Filter

Data

```
_:x rdf:type foaf:Person .  
_:x foaf:name "Peter" .  
_:y rdf:type foaf:Person .
```

Query Pattern

```
{ ?x rdf:type foaf:Person .  
  FILTER NOT EXISTS { ?x foaf:name ?name } }
```

- 1 $\llbracket \text{Bgp}(1. \text{Pattern}) \rrbracket_{\mathcal{G}}: \mu_1: ?x \mapsto _ :x, \mu_2: ?x \mapsto _ :y$
- 2 For each solution, we instantiate the second pattern
 - Solution is removed if the instantiated pattern matches (μ_1)
 - otherwise we keep the solution (μ_2)

Evaluation of Negation via Minus

Data

```

_:x rdf:type foaf:Person .
_:x foaf:name "Peter" .
_:y rdf:type foaf:Person .

```

Query Pattern

```

{ ?x rdf:type foaf:Person .
  MINUS { ?x foaf:name ?name } }

```

$\llbracket \text{Bgp}(1. \text{Pattern}) \rrbracket_{\text{G}}: \Omega_1 = \{ \mu_1: ?x \mapsto _ :x, \mu_2: ?x \mapsto _ :y \}$

$\llbracket \text{Bgp}(2. \text{Pattern}) \rrbracket_{\text{G}}: \Omega_2 = \{ \mu_3: ?x \mapsto _ :x, ?name \mapsto \text{"Peter"} \}$

$\llbracket \text{Minus}(\Omega_1, \Omega_2) \rrbracket_{\text{G}}: \Omega = \{ \mu \mid \mu \in \Omega_1 \text{ and } \forall \mu' \in \Omega_2 \quad \mu_1 \notin \Omega: \\ \mu \text{ and } \mu' \text{ are incompatible or} \\ \text{dom}(\mu) \cap \text{dom}(\mu') = \emptyset \}$

μ_1 compatible with μ_3 and non-disjoint domains

$\mu_3 \in \Omega; \mu_2$ incompatible with μ_3

Differences Minus and Filter Negation

Data

```
ex:a ex:b ex:c .
```

Query Pattern

```
{ ?s ?p ?o FILTER NOT EXISTS { ?x ?y ?z } }
```

- Filter pattern matches always (variables disjoint) \rightsquigarrow every solution is removed

Query Pattern

```
{ ?s ?p ?o MINUS { ?x ?y ?z } }
```

- Minus does not remove any solutions since the domain of the solutions is disjoint

Agenda

- 1 Recap
- 2 SPARQL 1.1 Query Extensions
 - Expressions in Selection and Bindings
 - Aggregates
 - Subqueries
 - Property Paths
 - Negation
- 3 SPARQL Protocol**
- 4 SPARQL Update
- 5 SPARQL Service Descriptions
- 6 Summary

SPARQL Protocol

- Specifies how queries can be sent to a SPARQL endpoint in the Web and how results are returned
- Specifies how errors are communicated
- Query
 - GET Query etc. is part of the URL:
`http://server/endpoint1?query=...`
 - POST Query is in the body of the HTTP request, e.g., via an HTML form
- Update
 - `http://server/endpoint2?update=...`
 - POST with content-type `application/sparql-update`
 - POST via HTML form
- Query and Update are separate services

Graph Store HTTP Protocol

- Application protocol for distributed updating and fetching of RDF graph content via HTTP
 - IRIs identify a graph in a graph store
 - GET to receive the graph content
 - PUT to send a query that modifies a graph
 - DELETE to delete a graph
 - POST to merge submitted RDF data into an existing graph

Agenda

- 1 Recap
- 2 SPARQL 1.1 Query Extensions
 - Expressions in Selection and Bindings
 - Aggregates
 - Subqueries
 - Property Paths
 - Negation
- 3 SPARQL Protocol
- 4 SPARQL Update**
- 5 SPARQL Service Descriptions
- 6 Summary

SPARQL Update

- For manipulation of graphs or graph content
- Based on the idea of a graph store (Quads)
 - Addition and removal of graphs
 - Addition and removal of triples in a graphs
- LOAD, DROP, CREATE
- INSERT, DELETE for data/triples
- No transactions, a query can consist of several atomic parts

Example Query

```
DELETE { ?person foaf:givenName "Bill" }
INSERT { ?person foaf:givenName "William" }
WHERE {
  ?person a foaf:Person .
  ?person foaf:givenName "Bill"
}
```

Agenda

- 1 Recap
- 2 SPARQL 1.1 Query Extensions
 - Expressions in Selection and Bindings
 - Aggregates
 - Subqueries
 - Property Paths
 - Negation
- 3 SPARQL Protocol
- 4 SPARQL Update
- 5 SPARQL Service Descriptions**
- 6 Summary

Service Descriptions

- Method and vocabulary for describing SPARQL endpoints
- Client/User can request information about the SPARQL service, e.g.,
 - supported extension functions,
 - used data set or
 - supported inference mechanisms

HTTP Request

```
GET /sparql/ HTTP/1.1
Host: www.example.org
Accept: text/turtle
```

Possible Response (beginning)

```
HTTP/1.1 200 OK
Date: Fri, 09 Oct 2009 17:31:12 GMT
Server: Apache/1.3.29 (Unix) PHP/4.3.4 DAV/1.0.3
Connection: close
Content-Type: text/turtle

Agenda

- 1 Recap
- 2 SPARQL 1.1 Query Extensions
 - Expressions in Selection and Bindings
 - Aggregates
 - Subqueries
 - Property Paths
 - Negation
- 3 SPARQL Protocol
- 4 SPARQL Update
- 5 SPARQL Service Descriptions
- 6 Summary

Summary

- We have learned about the main SPARQL 1.1 extensions
- SPARQL 1.1 is a recommendation since March 2013
- SPARQL UPDATE allows for modifying graphs
- Protocol specifies the client server communication
- Service Descriptions describe a SPARQL service (machine readable)
- Further result formats: JSON, CVS, TSV (not covered)

Outlook:

- Entailment Regimes: SPARQL with inferred results

Public SPARQL Endpoints

DBPedia structured Wikipedia Data (> 100 million triples):
