# Simple Tableau with Contradiction

$$(\neg p \vee q) \wedge p \wedge \neg q$$

## Simple Tableau with Contradiction

$$(\neg p \vee q) \wedge p \wedge \neg q$$

$$\neg p \vee q$$

$$p$$

$$\neg q$$

## Simple Tableau with Contradiction

## Simple Tableau with Contradiction

## Simple Tableau with Contradiction

- if a branch contains an atomic contradiction (clash), we call this branch closed

## Simple Tableau with Contradiction

- if a branch contains an atomic contradiction (clash), we call this branch closed
- a tableau is closed, if all its branches are

## Simple Tableau with Contradiction

- if a branch contains an atomic contradiction (clash), we call this branch closed
- a tableau is closed, if all its branches are
- a complete tableau without open branches shows the formula's unsatisfiability

## Constructing a Model from the Tableau

- given an open branch, we can construct a model

## Constructing a Model from the Tableau

- given an open branch, we can construct a model
- let  $I(p)=\text{false}$  and let  $I(q)=\text{false}$

## Constructing a Model from the Tableau

- given an open branch, we can construct a model
- let  $I(p)=\text{false}$  and let  $I(q)=\text{false}$
- let  $I(p)=\text{false}$  ( $I(q)$  is irrelevant since not in the branch, default assignment false)

## Constructing a Model from the Tableau

- given an open branch, we can construct a model
- let  $I(p)=\text{false}$  and let  $I(q)=\text{false}$
- let  $I(p)=\text{false}$  ( $I(q)$  is irrelevant since not in the branch, default assignment false)
- let  $I(q)=\text{false}$  ( $I(p)$  is irrelevant since not in the branch, default assignment false)

# Propositional Tableau

- not always exponentially many combinations have to be checked (as opposed to truth table method)
- branches can be built one after the other  $\rightsquigarrow$  only polynomial space needed
- if we care about satisfiability we can stop after constructing the first complete open branch

# Construction with only one Branch in Memory

$$(\neg p \vee q) \wedge p \wedge q$$

# Construction with only one Branch in Memory

$$(\neg p \vee q) \wedge p \wedge q$$

$$\neg p^{1a} \vee q^{1b}$$

$$p$$

$$q$$

- when encountering a disjunction we assign so-called choice points
- all extensions of the branch based on such a choice are also marked

# Construction with only one Branch in Memory

$$(\neg p \vee q) \wedge p \wedge q$$

$$\neg p^{1a} \vee q^{1b}$$

$$p$$

$$q$$

$$\neg p^{1a}$$

- when encountering a disjunction we assign so-called choice points
- all extensions of the branch based on such a choice are also marked

# Construction with only one Branch in Memory

$$(\neg p \vee q) \wedge p \wedge q$$

$$\neg p^{1a} \vee q^{1b}$$

$$p$$

$$q$$

$$\neg p^{1a}$$

$$\perp^{1a}$$

- when encountering a disjunction we assign so-called choice points
- all extensions of the branch based on such a choice are also marked
- when encountering a contradiction caused by a choice, remove marked formulae and try next choice

# Construction with only one Branch in Memory

$$(\neg p \vee q) \wedge p \wedge q$$

$$\neg p^{1a} \vee q^{1b}$$

$p$

$q$

~~$\neg p^{1a}$~~

~~$p^{1a}$~~

$q^{1b}$

- when encountering a disjunction we assign so-called choice points
- all extensions of the branch based on such a choice are also marked
- when encountering a contradiction caused by a choice, remove marked formulae and try next choice

# From Propositional Tableau to Tableau for DLs

How can the tableaux be extended for checking satisfiability of  $\mathcal{ALC}$  concepts?  
NB: initially, we assume no underlying knowledge base, thus unsatisfiability means that the concept is contradictory “by itself”.

- tableau represents an element of the domain (plus its “environment”)

# From Propositional Tableau to Tableau for DLs

How can the tableaux be extended for checking satisfiability of  $\mathcal{ALC}$  concepts?  
NB: initially, we assume no underlying knowledge base, thus unsatisfiability means that the concept is contradictory “by itself”.

- tableau represents an element of the domain (plus its “environment”)
- tableau branch: finite set of propositions of the form  $C(a)$ ,  $r(a, b)$
- for existential quantifiers, new domain elements are introduced
- universal quantifiers propagate formulae (=concept expressions) to neighboring elements

# Agenda

- Basic Idea of the Tableau Calculus
- Propositional Example
- Transformation into Negation Normal Form
- Satisfiability of  $\mathcal{ALC}$  Concepts
- Correctness and Termination
- Summary

# Propositional Logic – Some Logical Equivalences

- We aim at negations being present only in front of atomic concepts

$$\varphi \wedge \psi \equiv \psi \wedge \varphi$$

$$\varphi \rightarrow \psi \equiv \neg\varphi \vee \psi$$

$$\varphi \vee \psi \equiv \psi \vee \varphi$$

$$\varphi \leftrightarrow \psi \equiv (\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi)$$

$$\varphi \wedge (\psi \wedge \omega) \equiv (\varphi \wedge \psi) \wedge \omega$$

$$\neg(\varphi \wedge \psi) \equiv \neg\varphi \vee \neg\psi$$

$$\varphi \vee (\psi \vee \omega) \equiv (\varphi \vee \psi) \vee \omega$$

$$\neg(\varphi \vee \psi) \equiv \neg\varphi \wedge \neg\psi$$

$$\varphi \wedge \varphi \equiv \varphi$$

$$\neg\neg\varphi \equiv \varphi$$

$$\varphi \vee \varphi \equiv \varphi$$

$$\varphi \wedge (\psi \vee \varphi) \equiv \varphi$$

$$\varphi \vee (\psi \wedge \omega) \equiv (\varphi \vee \psi) \wedge (\varphi \vee \omega)$$

$$\varphi \vee (\psi \wedge \varphi) \equiv \varphi$$

$$\varphi \wedge (\psi \vee \omega) \equiv (\varphi \wedge \psi) \vee (\varphi \wedge \omega)$$

## Further Logical Equivalences

$$\neg(C \sqcap D) \rightsquigarrow \neg C \sqcup \neg D$$

$$\neg(D \sqcup D) \rightsquigarrow \neg C \sqcap \neg D$$

$$\neg\neg C \rightsquigarrow C$$

$$\neg(\forall r.C) \rightsquigarrow \exists r.(\neg C)$$

$$\neg(\exists r.C) \rightsquigarrow \forall r.(\neg C)$$

$$\neg(\leq n s.C) \rightsquigarrow \geq n + 1 s.C$$

$$\neg(\geq n s.C) \rightsquigarrow \leq n - 1 s.C, \quad n \geq 1$$

$$\neg(\geq 0 s.C) \rightsquigarrow \perp$$

- apply these rules iteratively until none can be applied any more  
 $\rightsquigarrow$  equivalent concept in negation normal form

# NNF Transformation

recursive definition of an NNF transformation:

if  $C$  atomic:

$$NNF(C) := C$$

$$NNF(\neg C) := \neg C$$

otherwise:

$$NNF(\neg\neg C) := NNF(C)$$

$$NNF(C \sqcap D) := NNF(C) \sqcap NNF(D) \quad NNF(\neg(C \sqcap D)) := NNF(\neg C) \sqcup NNF(\neg D)$$

$$NNF(C \sqcup D) := NNF(C) \sqcup NNF(D) \quad NNF(\neg(C \sqcup D)) := NNF(\neg C) \sqcap NNF(\neg D)$$

$$NNF(\forall r.C) := \forall r.(NNF(C)) \quad NNF(\neg(\forall r.C)) := \exists r.(NNF(\neg C))$$

$$NNF(\exists r.C) := \exists r.(NNF(C)) \quad NNF(\neg(\exists r.C)) := \forall r.(NNF(\neg C))$$

$$NNF(\leq n s.C) := \leq n s.(NNF(C)) \quad NNF(\neg(\leq n s.C)) := \geq n + 1 s.(NNF(C))$$

$$NNF(\geq n s.C) := \geq n s.(NNF(C)) \quad NNF(\neg(\geq n s.C)) := \leq n - 1 s.(NNF(C))$$

if  $n \geq 1$

$$NNF(\geq 0 s.C) := \top \quad NNF(\neg(\geq 0 s.C)) := \perp \quad \text{otherwise}$$

## NNF Transformation – Example

$$\begin{aligned} & NNF(\neg(\neg C \sqcap (\neg D \sqcup E))) \\ = & NNF(\neg\neg C) \sqcup NNF(\neg(\neg D \sqcup E)) \\ = & NNF(C) \sqcup NNF(\neg(\neg D \sqcup E)) \\ = & C \sqcup NNF(\neg(\neg D \sqcup E)) \\ = & C \sqcup (NNF(\neg\neg D) \sqcap NNF(\neg E)) \\ = & C \sqcup (NNF(D) \sqcap NNF(\neg E)) \\ = & C \sqcup (D \sqcap NNF(\neg E)) \\ = & C \sqcup (D \sqcap \neg E) \end{aligned}$$

# Agenda

- Basic Idea of the Tableau Calculus
- Propositional Example
- Transformation into Negation Normal Form
- Satisfiability of  $\mathcal{ALC}$  Concepts
- Correctness and Termination
- Summary

## Tableau for $\mathcal{ALC}$ Concepts

- tableau for a propositional formula  $\alpha$ : one element, labeled with subformulae of  $\alpha$
- tableau for an  $\mathcal{ALC}$  concept  $C$ : graph (more precisely: tree) where the nodes are labeled with subformulae of  $C$
- root labeled with  $C$
- represents model for  $C$  (if complete and clash-free)
- non-root nodes are enforced by existential quantifiers

### Definition

Let  $C$  be an  $\mathcal{ALC}$  concept,  $SF(C)$  the set of all subformulae of  $C$  and  $Roll(C)$  the set of all roles occurring in  $C$ . A tableau for  $C$  is a tree  $G = \langle V, E, L \rangle$ , with nodes  $V$ , edges  $E \subseteq V \times V$  and a labeling function  $L$  with  $L: V \rightarrow 2^{SF(C)}$  and  $L: V \times V \rightarrow 2^{Roll(C)}$ .

## Properties of the $\mathcal{ALC}$ Tableau Algorithm

- the algorithm is specified as a set of rules
- every rule breaks down a complex concept into its parts
- rules applicable in any order
- the algorithm is non-deterministic (due to disjunction)
- check for atomic contradictions

tableau algorithm for checking satisfiability of  $\mathcal{ALC}$  concepts

**Input:** an  $\mathcal{ALC}$  concept in NNF

**Output:** `true` if there is a clash-free tableau  
where no more rules can be applied  
`false` otherwise (tableau closed)

## Tableau Rules for $\mathcal{ALC}$ Concepts

- $\sqcap$ -rule: For an arbitrary  $v \in V$  mit  $C \sqcap D \in L(v)$  and  $\{C, D\} \not\subseteq L(v)$ , let  $L(v) := L(v) \cup \{C, D\}$ .
- $\sqcup$ -rule: For an arbitrary  $v \in V$  with  $C \sqcup D \in L(v)$  and  $\{C, D\} \cap L(v) = \emptyset$ , choose  $X \in \{C, D\}$  and let  $L(v) := L(v) \cup \{X\}$ .
- $\exists$ -rule: For an arbitrary  $v \in V$  with  $\exists r.C \in L(v)$  such that there is no  $r$ -successor  $v'$  of  $v$  with  $C \in L(v')$ , let  $V = V \cup \{v'\}$ ,  $E = E \cup \{\langle v, v'\rangle\}$ ,  $L(v') := \{C\}$  and  $L(v, v') := \{r\}$  for  $v'$  a new node.
- $\forall$ -rule: For arbitrary  $v, v' \in V$ ,  $v'$   $r$ -neighbor of  $v$ ,  $\forall r.C \in L(v)$  and  $C \notin L(v')$ , let  $L(v') := L(v') \cup \{C\}$ .
- a node  $v'$  is an  $r$ -neighbor of a node  $v$  if  $\langle v, v'\rangle \in E$  and  $r \in L(v, v')$

## Tableau Rules for $\mathcal{ALC}$ Concepts

- $\sqcap$ -rule: For an **arbitrary**  $v \in V$  mit  $C \sqcap D \in L(v)$  and  $\{C, D\} \not\subseteq L(v)$ , let  $L(v) := L(v) \cup \{C, D\}$ .
- $\sqcup$ -rule: For an **arbitrary**  $v \in V$  with  $C \sqcup D \in L(v)$  and  $\{C, D\} \cap L(v) = \emptyset$ , choose  $X \in \{C, D\}$  and let  $L(v) := L(v) \cup \{X\}$ .
- $\exists$ -rule: For an **arbitrary**  $v \in V$  with  $\exists r.C \in L(v)$  such that there is no  $r$ -successor  $v'$  of  $v$  with  $C \in L(v')$ , let  $V = V \cup \{v'\}$ ,  $E = E \cup \{\langle v, v'\rangle\}$ ,  $L(v') := \{C\}$  and  $L(v, v') := \{r\}$  for  $v'$  a new node.
- $\forall$ -rule: For **arbitrary**  $v, v' \in V$ ,  $v'$   $r$ -neighbor of  $v$ ,  $\forall r.C \in L(v)$  and  $C \notin L(v')$ , let  $L(v') := L(v') \cup \{C\}$ .
- a node  $v'$  is an  $r$ -neighbor of a node  $v$  if  $\langle v, v'\rangle \in E$  and  $r \in L(v, v')$
  - rule application order: “don’t care” non-determinism

## Tableau Rules for $\mathcal{ALC}$ Concepts

- $\sqcap$ -rule: For an arbitrary  $v \in V$  mit  $C \sqcap D \in L(v)$  and  $\{C, D\} \not\subseteq L(v)$ , let  $L(v) := L(v) \cup \{C, D\}$ .
- $\sqcup$ -rule: For an arbitrary  $v \in V$  with  $C \sqcup D \in L(v)$  and  $\{C, D\} \cap L(v) = \emptyset$ , choose  $X \in \{C, D\}$  and let  $L(v) := L(v) \cup \{X\}$ .
- $\exists$ -rule: For an arbitrary  $v \in V$  with  $\exists r.C \in L(v)$  such that there is no  $r$ -successor  $v'$  of  $v$  with  $C \in L(v')$ , let  $V = V \cup \{v'\}$ ,  $E = E \cup \{\langle v, v'\rangle\}$ ,  $L(v') := \{C\}$  and  $L(v, v') := \{r\}$  for  $v'$  a new node.
- $\forall$ -rule: For arbitrary  $v, v' \in V$ ,  $v'$   $r$ -neighbor of  $v$ ,  $\forall r.C \in L(v)$  and  $C \notin L(v')$ , let  $L(v') := L(v') \cup \{C\}$ .
- a node  $v'$  is an  $r$ -neighbor of a node  $v$  if  $\langle v, v'\rangle \in E$  and  $r \in L(v, v')$
  - rule application order: “don’t care” non-determinism
  - choice of disjunction: “don’t know” non-determinism

## Tableau Algorithmus Example

$$C = \exists r.(A \sqcup \exists r.B) \sqcap \exists r.\neg A \sqcap \forall r.(\neg A \sqcap \forall r.(\neg B \sqcup A))$$

$u$

$$L(u) = \{C\}$$

## Tableau Algorithmus Example

$$C = \exists r.(A \sqcup \exists r.B) \sqcap \exists r.\neg A \sqcap \forall r.(\neg A \sqcap \forall r.(\neg B \sqcup A))$$

*u*

$$L(u) = \{C, \exists r.(A \sqcup \exists r.B), \\ \exists r.\neg A, \forall r.(\neg A \sqcap \forall r.(\neg B \sqcup A))\}$$

## Tableau Algorithmus Example

$$L(x) = \{B, \neg B \sqcup A, B\}$$

## Tableau Algorithmus Example

$$C = \exists r.(A \sqcup \exists r.B) \sqcap \exists r.\neg A \sqcap \forall r.(\neg A \sqcap \forall r.(\neg B \sqcup A))$$

$$L(u) = \{C, \exists r.(A \sqcup \exists r.B), \\ \exists r.\neg A, \forall r.(\neg A \sqcap \forall r.(\neg B \sqcup A))\}$$

$$L(v) = \{A \sqcup \exists r.B, \neg A, \forall r.(\neg B \sqcup A), \exists r.B\}$$

$$L(w) = \{\neg A, \forall r.(\neg B \sqcup A)\}$$

$$L(x) = \{B, \neg B \sqcup A, A\}$$

## Tableau Algorithm Example

the model  $\mathcal{I}$  constructed by the algorithm is the following:

$$\Delta^{\mathcal{I}} = \{u, v, w, x\}$$

$$A^{\mathcal{I}} = \{x\}$$

$$B^{\mathcal{I}} = \{x\}$$

$$r^{\mathcal{I}} = \{\langle u, v \rangle, \langle u, w \rangle, \langle v, x \rangle\}$$

Check that indeed  $C^{\mathcal{I}} = \{u\}$ , given the defined semantics of  $\mathcal{ALC}$

# Tableau Algorithm Properties

- 1 the model is **finite**: only finitely many elements in the domain
- 2 the model is **tree-shaped**: the tableau is a labeled tree

the algorithm will always construct finite trees

- from a clash-free tableau, we can construct a finite model
- if there is no clash-free tableau, there is no model

# Agenda

- Basic Idea of the Tableau Calculus
- Propositional Example
- Transformation into Negation Normal Form
- Satisfiability of  $\mathcal{ALC}$  Concepts
- Correctness and Termination
- Summary

## Tableau Properties

- the depth (number of nested quantifiers) decreases in every node
- every node is labeled only with subformulae of  $C$
- $C$  has only polynomially many subformulae
- if the output is `true` we can build a model out of the constructed tableau
- on the other hand, we can use a model of a satisfiable concept to construct a clash-free tableau for this concept

# Tableau Algorithm for $\mathcal{ALC}$ Concepts

## Theorem

- 1 the algorithm terminates for every input
- 2 if the output is *true*, then the input concept is satisfiable
- 3 if the input concept is satisfiable, then the output is *true*.

# Tableau Algorithm for $\mathcal{ALC}$ Concepts

## Theorem

- 1 the algorithm terminates for every input
- 2 if the output is *true*, then the input concept is satisfiable
- 3 if the input concept is satisfiable, then the output is *true*.

## Corollary

Every  $\mathcal{ALC}$  concept  $C$  has the following properties:

- 1 **finite model property**: If  $C$  has a model, then it has a finite one.
- 2 **tree model property**: If  $C$  has a model, then it has a tree-shaped one.

# Agenda

- Basic Idea of the Tableau Calculus
- Propositional Example
- Transformation into Negation Normal Form
- Satisfiability of  $\mathcal{ALC}$  Concepts
- Correctness and Termination
- Summary

# Summary

- we now have a constructive method for building model abstractions
- satisfiable  $\mathcal{ALC}$  concepts always have a finite model that we can construct
- the algorithm is correct, complete and terminating
- serves as basis for practically implemented algorithms
- next: extension to knowledge bases
